1 Essentials

1.1 C++ header

```
# include <bits/stdc++.h>
using namespace std;
# define rep(i, a, b) for(int i = a; i < (b); ++i)
# define trav(a, x) for(auto& a : x)
typedef long long ll;
typedef pair<int, int> pii;
typedef vector<int> vi;
```

1.2 C++ flags

```
# Add this to the CMakeLists in CLion to crash with bad memory accesses and give better warnings.
# Don't include this comment, comments don't work in CMakeLists.
set(CMAKE_CXX_STANDARD 17)
set(CMAKE_CXX_FLAGS "${CMAKE_CXX_FLAGS} -Wall -Wextra -Wno-sign-compare -D _GLIBCXX_DEBUG -D _GLIBCXX_DEBUG PDDANTIC ")
```

1.3 C++ input/output

```
#include <iostream>
#include <iomanip>
#include <bitset>
using namespace std;
int main() {
    // Output a specific number of digits past the decimal point,
    // in this case 5
    cout.setf(ios::fixed);
    cout << setprecision(5);
cout << 100.0 / 7.0 << " " << 10.0 << endl; // 14.28571 10.00000</pre>
    cout.unsetf(ios::fixed);
    // Output a '+' before positive values
    cout.setf(ios::showpos);
cout << 100 << " " << -100 << endl; // +100 -100</pre>
    cout.unsetf(ios::showpos);
    // Output numerical values in hexadecimal. Also works for oct
    cout << hex << 500 << dec << endl; // 1f4 (1*256 + 15*16 + 4*1)
    // Output numerical values in binary
    std::bitset<10> bs(500);
    cout << bs << endl; // 0111110100
    // Read until end of file.
    string line;
    getline(cin, line);
    while (!line.empty()) { // Input in CP problems always ends with an empty line.
        int intV; string stringV;
        stringstream line_stream(line);
        line_stream >> stringV >> intV; // Just read like usual from the stream
        getline(cin, line);
```

2 Data structures

2.1 Unordered Set/Map

```
// An example of policy hashtable with a custom object in cpp. It is
// it is better than the built in unordered_map in that
// it is "5 times faster. (https://codeforces.com/blog/entry/60737)
// No real downsides (normal map is just as annoying with custom objects),
// but be careful with the hash function, the number of buckets is a power of 2.
#include <br/>
district Coordinate {
   int x;
struct Coordinate {
   int x;
```

```
int v;
     bool operator==(const Coordinate &other) const {
         return x == other.x && y == other.y;
ostream &operator<<(ostream &stream, const Coordinate &1) {
   return stream << "{" << 1.x << " " << 1.y << "}";</pre>
#include <ext/pb_ds/assoc_container.hpp>
struct chash {
    static auto const c = uint64_t(7e18) + 13; // Big prime
uint64_t operator()(const Coordinate &1) const {
         return __builtin_bswap64((1.x + 1.y) * c);
1:
template<class k, class v>
using hash_map = __gnu_pbds::gp_hash_table<k, v, chash>;
template<class k>
using hash_set = __qnu_pbds::qp_hash_table<k, __qnu_pbds::null_type, chash>;
template<typename k, typename v>
bool contains(hash_map<k, v> map, k val) {
   return map.find(val) != map.end();
int main() {
     // After importing, writing the template code, overloading ==
     // and << (print) operator like above, you can use the map
    hash_map<Coordinate, int> my_map;
     my_map[{1, 2}] = 17;
     cout << my_map[{1, 2}] << endl; // Prints 17</pre>
     assert (contains (my_map, {1, 2}));
     assert(!contains(my_map, {3, 4}));
     cout << my_map[{3, 4}] << endl; // Prints 0
assert(my_map.size() == 2); // We just set {3, 4} to 0 by accessing it.</pre>
     for (auto pair : my_map) {
    cout << pair.first << "=" << pair.second << " "; // {3 4}=0 {1 2}=17</pre>
    hash_set<Coordinate> my_set;
    assert (my_set.empty());
    my_set.insert({1, 2});
     assert (contains (my_set, {1, 2}));
     my_set.insert({4, 5});
     // hash_set does the correct thing, and when you iterate over it you get keys,
         not key-value pairs with a null value.
     for (auto it = my_set.begin(); it != my_set.end(); it++) {
   cout << *it << " "; // print {4, 5} {1, 2}.</pre>
     // Standard C Library Equivalent Declarations:
     // unordered_map<Coordinate, int, chash> my_map;
      // unordered_set<Coordinate, chash> my_set;
```

2.2 Ordered Set/Map

```
// An example of using an ordered map with a custom object.
// Also include code for the gnu policy tree, which gives
// a easy (~2x slower) segment tree by implementing
// find_by_order and order_of_key
#include <bits/stdc++.h>
using namespace std;
struct Coordinate {
    int x:
    int v:
    // Overloaded for ordered map. If !(c1<c2), !(c2<c1), then
       c1 will be considered equal to c2.
    bool operator<(const Coordinate &o) const {
        return x == 0.x ? y < 0.y : x < 0.x;
1:
ostream &operator<<(ostream &stream, const Coordinate &1) {
    return stream << "{" << 1.x << " " << 1.y << "}";</pre>
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
using namespace gnu pbds;
template<class k, class v>
using ordered_map = tree<k, v, less<k>,
        rb_tree_tag, // Red black tree. Can use splay_tree_tag for a splay tree,
```

```
// but split operation for splay is linear time so it may be terrible.
        tree_order_statistics_node_update // To get find_by_order and order_of_key methods
template < class k > // Same as ordered map almost
using ordered_set = tree<k, null_type, less<k>,
        rb_tree_tag, tree_order_statistics_node_update>;
    map<Coordinate, int> c_map; // Standard C Library Ordered Map
    set<Coordinate> c_set; // Standard C Library Ordered Set
    ordered_map<Coordinate, int> gnu_map; // Gnu map declaration
    ordered_set<Coordinate> gnu_set;// Gnu set declaration
    for (int i = 0; i < 10; i++) {
        gnu_set.insert({0, i * 10});
    cout << *qnu_set.find({0, 30}) << endl; // {0, 30}
    cout << *gnu_set.lower_bound({0, 53}) << endl; // {0, 60}
    cout << *gnu_set.upper_bound({0, 53}) << endl; // {0, 60}
    cout << *gnu_set.lower_bound({0, 50}) << endl; // {0, 50})
    cout << *gnu_set.upper_bound({0, 50}) << endl; // {0, 60}</pre>
    // Example of the operations only supported by gnu_set
    cout << *gnu_set.find_by_order(2) << end1; // {0 20}
cout << *gnu_set.find_by_order(4) << end1; // {0 40}</pre>
    assert(end(gnu_set) == gnu_set.find_by_order(10));
cout << gnu_set.order_of_key({0, -99}) << endl; // 0</pre>
    cout << gnu_set.order_of_key({0, 0}) << endl; // 0
    cout << gnu_set.order_of_key({0, 11}) << endl; // 2</pre>
    cout << gnu_set.order_of_key({0, 999}) << endl; // 10</pre>
```

2.3 Suffix array

```
// Suffix array construction in O(L log^2 L) time. Routine for
// computing the length of the longest common prefix of any two
// suffixes in O(log L) time.
// INPUT: string s
// OUTPUT: array suffix[] such that suffix[i] = index (from 0 to L-1)
            of substring s[i...L-1] in the list of sorted suffixes.
             That is, if we take the inverse of the permutation suffix[],
             we get the actual suffix array.
#include <vector>
#include <iostream>
using namespace std;
struct SuffixArray {
    const int L;
    vector<vector<int> > P;
    vector<pair<int, int>, int> > M;
    Suffix Array (\textbf{const} \ string \ \&s) \ : \ L(s.length()), \ s(s), \ P(1, \ vector < \textbf{int} > (L, \ 0)), \ M(L) \ \{ (1, \ 0), \ M(L) \} \}
        for (int i = 0; i < L; i++) P[0][i] = int(s[i]);
for (int skip = 1, level = 1; skip < L; skip *= 2, level++) {</pre>
             P.push_back(vector<int>(L, 0));
             for (int i = 0; i < L; i++)
                 M[i] = make\_pair(make\_pair(P[level - 1][i], i + skip < L ? P[level - 1][i + skip] :
                       -1000), i);
             sort(M.begin(), M.end());
             for (int i = 0; i < L; i++)
                 P[level][M[i].second] = (i > 0 \&\& M[i].first == M[i - 1].first) ? P[level][M[i - 1].
                       secondl : i:
    vector<int> GetSuffixArray() { return P.back(); }
     // returns the length of the longest common prefix of s[i...L-1] and s[j...L-1]
    int LongestCommonPrefix(int i, int j) {
        int len = 0:

5.6 Euler's Toitent Function

```
* Author: Hakan Terelius
 * Date: 2009-09-25
 * License: CC0
 * Description: Precompute the number of positive integers coprime to N up to a given limit.
 \star - The sum phi(d) for all divisors d of n is equal to n.
 \star - The sum of all positive numbers less than n that are coprime to n is n phi(n) / 2 (n > 1)
 \star - For any a, n coprime, a^(phi(n)) = 1 mod n
 * - Specifically, for any prime p, any number a, a^{p-1} = 1 \mod p
 * Status: Tested
#pragma once

6.3 Fast Dijkstra's algorithm

```
// Implementation of Dijkstra's algorithm using adjacency lists
// and priority queue for efficiency.
// Running time: O(|E| log |V|)
#include <queue>
#include <cstdio>
using namespace std;
const int INF = 2000000000;
typedef pair<int, int> PII;
int main() {
    int N, s, t;
    scanf("%d%d%d", &N, &s, &t);
    vector<vector<PII> > edges(N);
    for (int i = 0; i < N; i++) {
        int M;
        scanf("%d", &M);
        for (int j = 0; j < M; j++) {
   int vertex, dist;</pre>
            scanf("%d%d", &vertex, &dist);
            edges[i].push_back(make_pair(dist, vertex)); // note order of arguments here
    // use priority queue in which top element has the "smallest" priority
    priority_queue<PII, vector<PII>, greater<PII> > Q;
    vector<int> dist(N, INF), dad(N, -1);
    Q.push(make_pair(0, s));
    dist[s] = 0;
    while (!Q.empty()) {
        PII p = Q.top();
        Q.pop();
        int here = p.second;
        if (here == t) break;
        if (dist[here] != p.first) continue;
        for (vector<PII>::iterator it = edges[here].begin(); it != edges[here].end(); it++) {
            if (dist[here] + it->first < dist[it->second]) {
                 dist[it->second] = dist[here] + it->first;
                 dad[it->second] = here;
                 Q.push(make_pair(dist[it->second], it->second));
    printf("%d\n", dist[t]);
if (dist[t] < INF)
    for (int i = t; i != -1; i = dad[i])</pre>
            printf("%d%c", i, (i == s ? '\n' : ' '));
Sample input:
2 1 2 3 1
2 2 4 4 5
3 1 4 3 3 4 1
2 0 1 2 3
2 1 5 2 1
4 2 3 0
```

6.4 Strongly connected components

```
vi val, comp, z, cont;
int Time, ncomps;
// A function that will be called with the indicies of all elements
// in each component as the parameter once per component after running scc.
void f(vi node_inds) {};
int dfs(int j, vector<vi>6 g) {
   int low = val[j] = ++Time, x; z.push_back(j);
   for (auto e: g[j]) if (comp[e] < 0)
        low = min(low, val[e] ?: dfs(e,g));

if (low == val[j]) {
        do {
            x = z.back(); z.pop_back();
        }
}</pre>
```

```
comp[x] = ncomps;
cont.push_back(x);
} while (x != j);
f(cont); cont.clear();
ncomps++;
}
return val[j] = low;
}
void scc(vector<vi>é g) {
   int n = g.size();
   val.assign(n, 0); comp.assign(n, -1);
   Time = ncomps = 0;
   rep(i,0,n) if (comp[i] < 0) dfs(i, g);
}</pre>
```

6.5 Eulerian path

```
struct Edge;
typedef list<Edge>::iterator iter;
struct Edge {
    int next_vertex;
    iter reverse_edge;
    Edge (int next vertex)
            : next_vertex(next_vertex) {}
const int max_vertices =;
int num_vertices;
list <Edge> adj[max_vertices];
                                      // adjacency list
vector<int> path;
void find_path(int v) {
    while (adj[v].size() > 0) {
        int vn = adj[v].front().next_vertex;
        adj[vn].erase(adj[v].front().reverse_edge);
        adj[v].pop_front();
        find_path(vn);
    path.push_back(v);
void add_edge(int a, int b) {
    adj[a].push_front(Edge(b));
    iter ita = adj[a].begin();
    adj[b].push_front(Edge(a));
    iter itb = adj[b].begin();
    ita->reverse_edge = itb;
    itb->reverse_edge = ita;
```

6.6 Minimum spanning trees

```
// This function runs Prim's algorithm for constructing minimum
// weight spanning trees.
// Running time: O(|V|^2)
     INPUT: w[i][j] = cost \ of \ edge \ from \ i \ to \ j
              NOTE: Make sure that w[i][j] is nonnegative and
              symmetric. Missing edges should be given -1
    OUTPUT: edges = list of pair<int,int> in minimum spanning tree
              return total weight of tree
